

A challenge of Laser-Plasma Accelerators toward High Energy Frontier

Kazuhisa NAKAJIMA
KEK
at

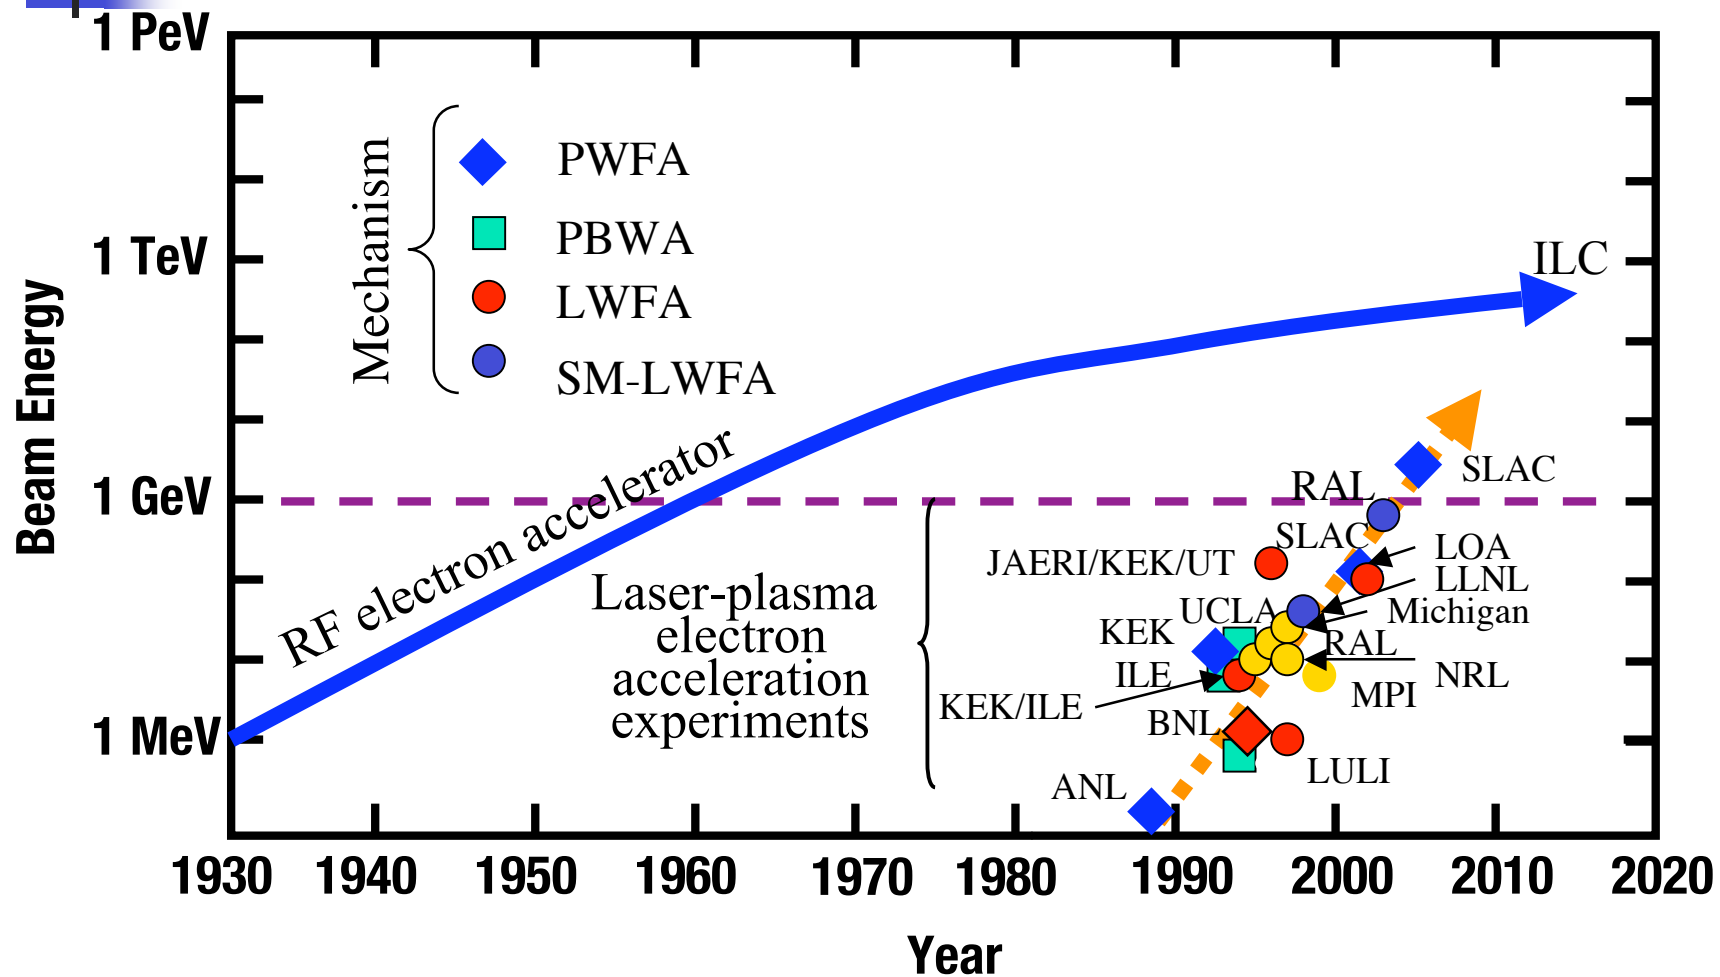

U.S. – Japan Workshop on Heavy Ion Fusion
and High Energy Density Physics
Utsunomiya University, September 28 –30, 2005

OUTLINE

- Recent progress of laser & plasma acceleration
- High energy acceleration mechanism with self-injection
- Super high average power laser driver for Multi-TeV laser collider
- Capillary plasma channel development

Laser Plasma Accelerators challenge high-energy frontier with low-cost, high-quality beams

Super-high fields of lasers promise high-quality, high-energy beams

Higher electric fields without breakdown

The state-of-the-art laser field $\sim 1 \times 10^{12}$ V/cm

Vacuum breakdown of laser fields to e^+e^- generation

1.6×10^{16} V/cm

Very short wavelength

Very short pulse

Very good coherency

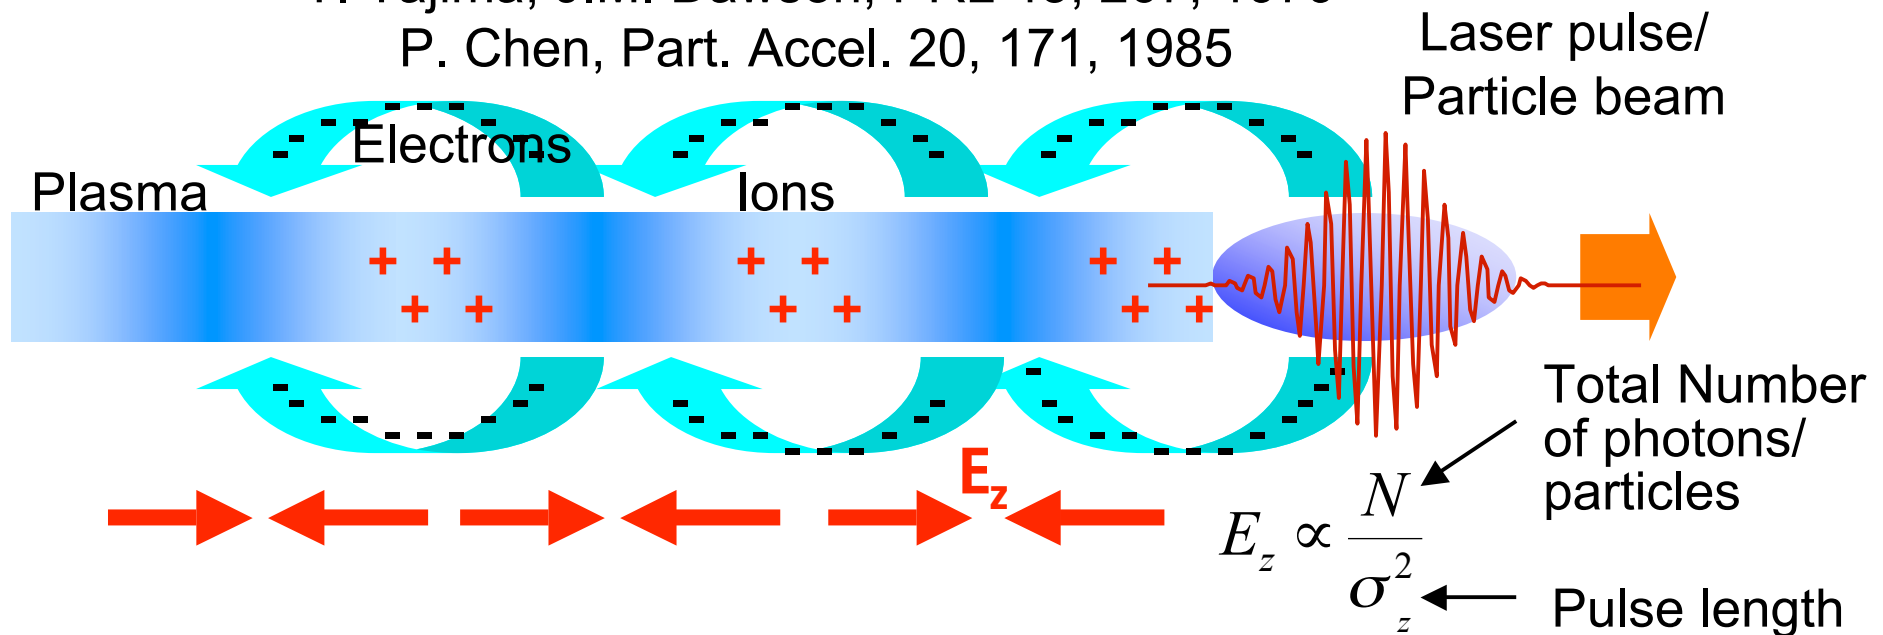

Femto-, Atto- high quality beams

JAERI-APRC PW laser

Laser/Plasma Wake Field Accelerator concept

T. Tajima, J.M. Dawson, PRL 43, 267, 1979
 P. Chen, Part. Accel. 20, 171, 1985

- Ponderomotive/space charge force of driving pulse expels plasma electrons.
- Plasma ions exert restoring force.
- Space charge oscillations are excited.

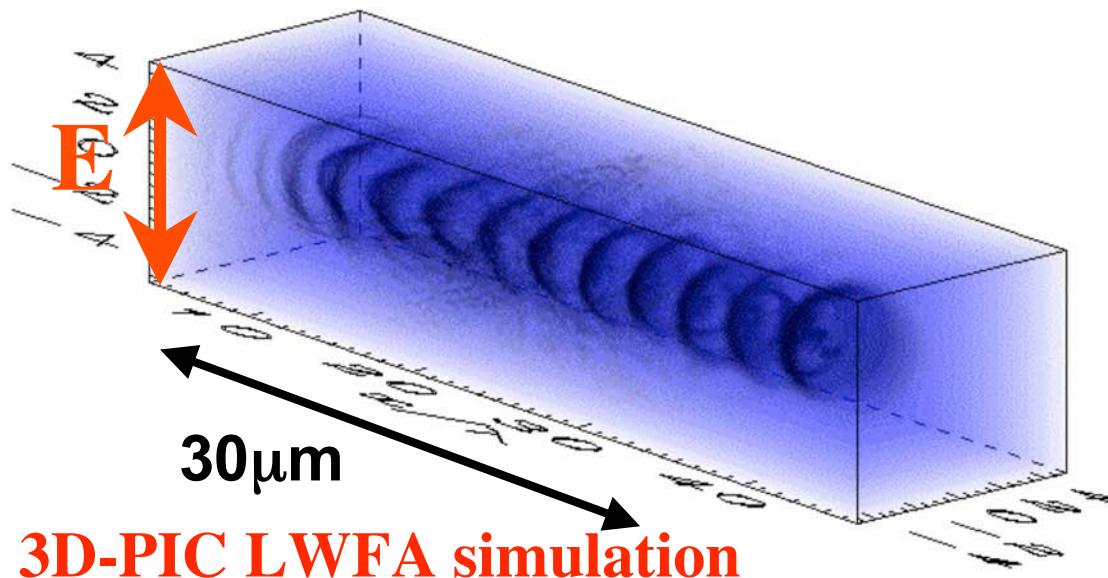

Plasma accelerators can generate more than 100 GV/m

The wave breaking amplitude

$$E_{\max} [\text{V/cm}] \sim n_e^{1/2} [\text{cm}^{-3}]$$

$$\text{e.g. } E_{\max} \sim 100 \text{ GV/m}$$

$$\text{for } n_e = 10^{18} \text{ cm}^{-3}$$

3D-PIC LWFA simulation
by Timur Esirkepov, JAERI

First proof-of-principle LWFA experiment at KEK/ILE 1993

30 GeV/m Self-Modulated Laser Wakefield was observed.

1 ps 30TW laser

Fig. 2. Schematic of the experimental setup.

"Observation of Ultrahigh Gradient Electron Acceleration by a Self-Modulated Intense Short Laser Pulse"

K. Nakajima et al., *Physical Review Letters*, 74, pp. 4428-4431 (1995)

First experiment showed monoenergetic property.

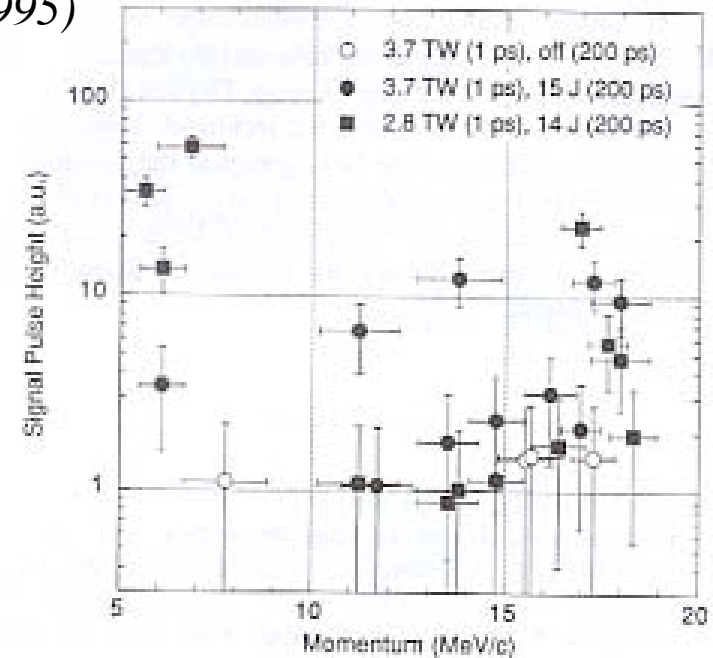

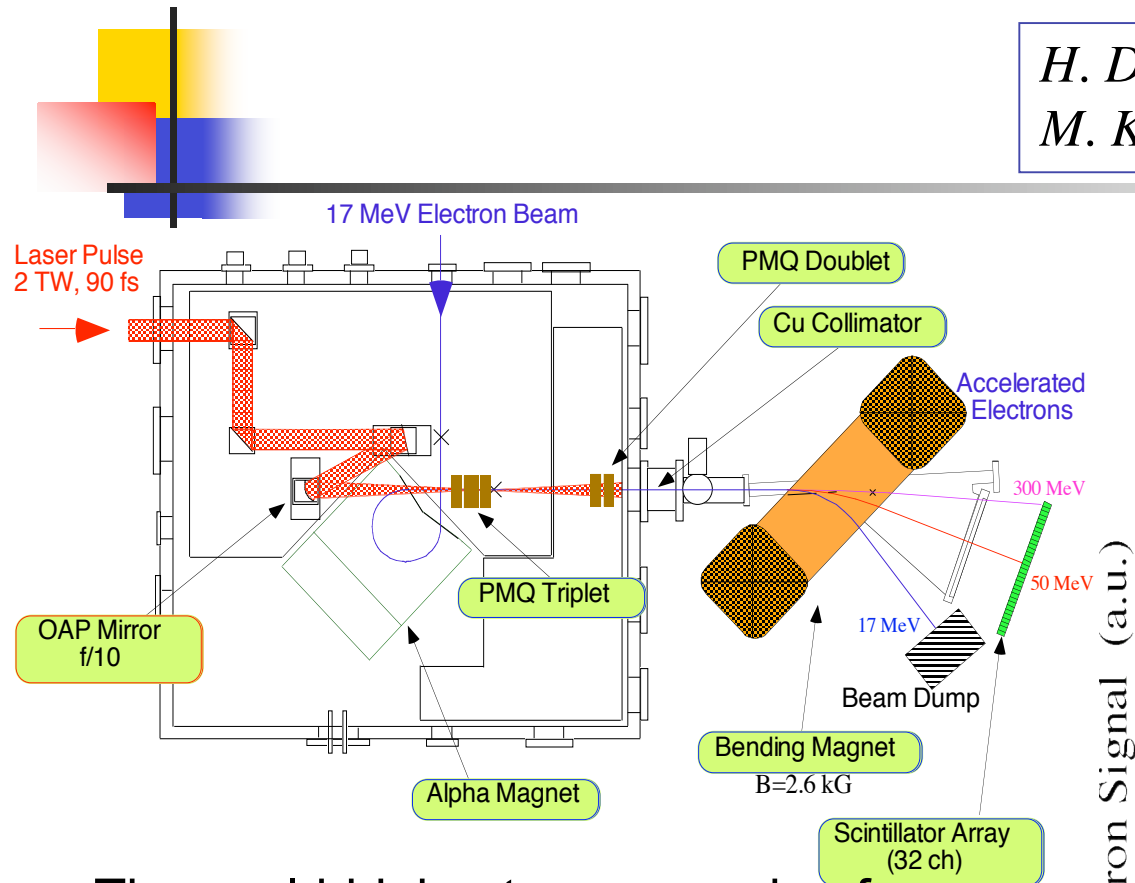

FIG. 2. Observed momentum spectra of accelerated electrons for a He gas jet at the buck pressure 7.8 atm.

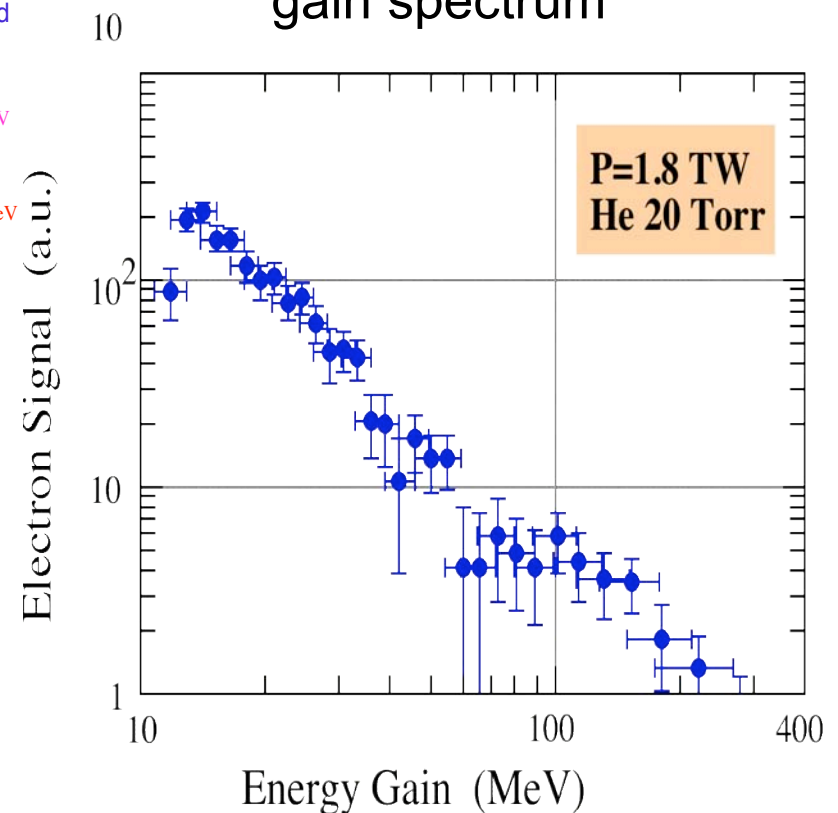

High-energy gain standard-LWFA experiment at JAERI-KEK-U. Tokyo, 1996

H. Dewa et al., NIM A410, 357, 1998
M. Kando et al., JJAP, 38, L967, 1999

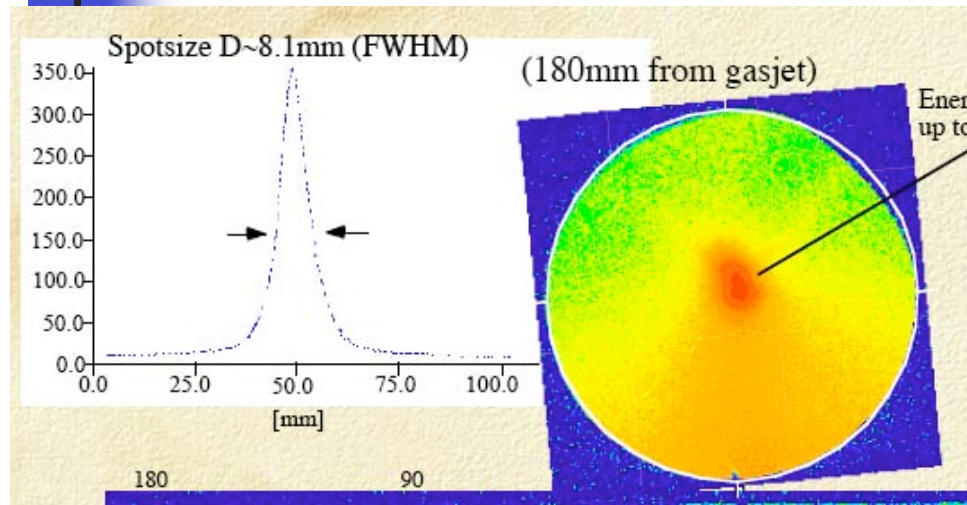

The world-highest energy gain of >250 MeV has been achieved by LWFA experiments using 2TW, 90fs T³ laser and 17 MeV electron linac.

Measured energy gain spectrum

High quality electron beam generation experiment at U. Tokyo-JAERI

T. Hosokai et al., Phys. Rev. E 67, 036407, 2003

He $2.8 \times 10^{19} \text{ cm}^{-3}$,
Laser $\sim 4.8 \text{ TW}$, $a_0 \sim 2.0$

Energy of e-beam up to 40 MeV

Emittance $\sim 0.1\pi \text{ mm mrad}$

Charge $\sim 100 \text{ pC}$

Duration $\sim 40 \text{ fs}$

Energy spectrum

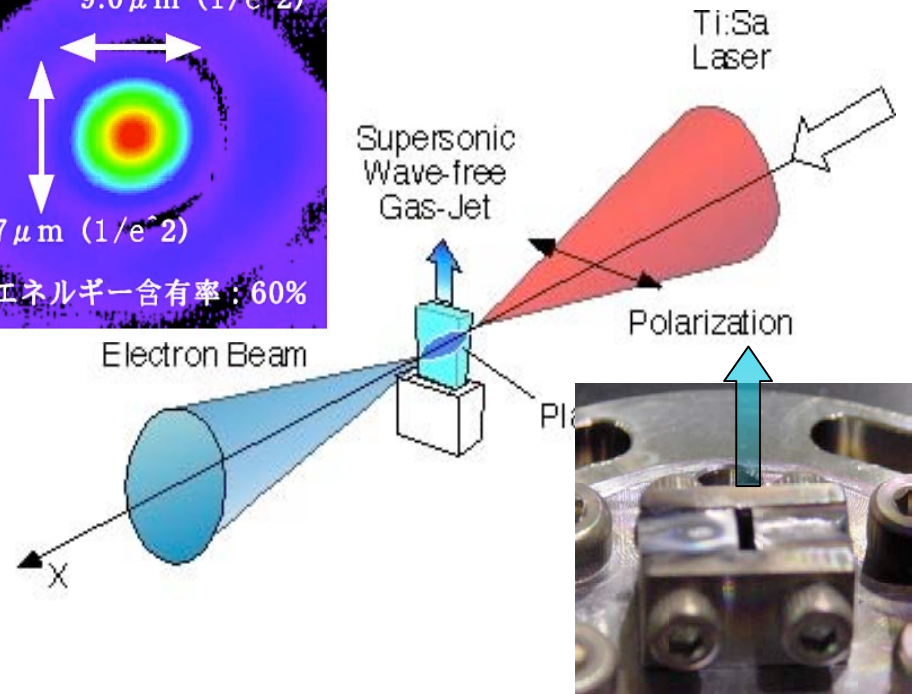

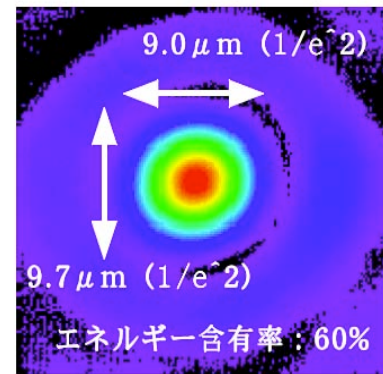

Laser plasma acceleration setup at JAERI-APRC

Plasma

Gas: Helium
 Plasma density: $\sim 1.4 \times 10^{20} \text{ cm}^{-3}$
 Slit dimension: $1.3 \times 4.0 \text{ mm}$

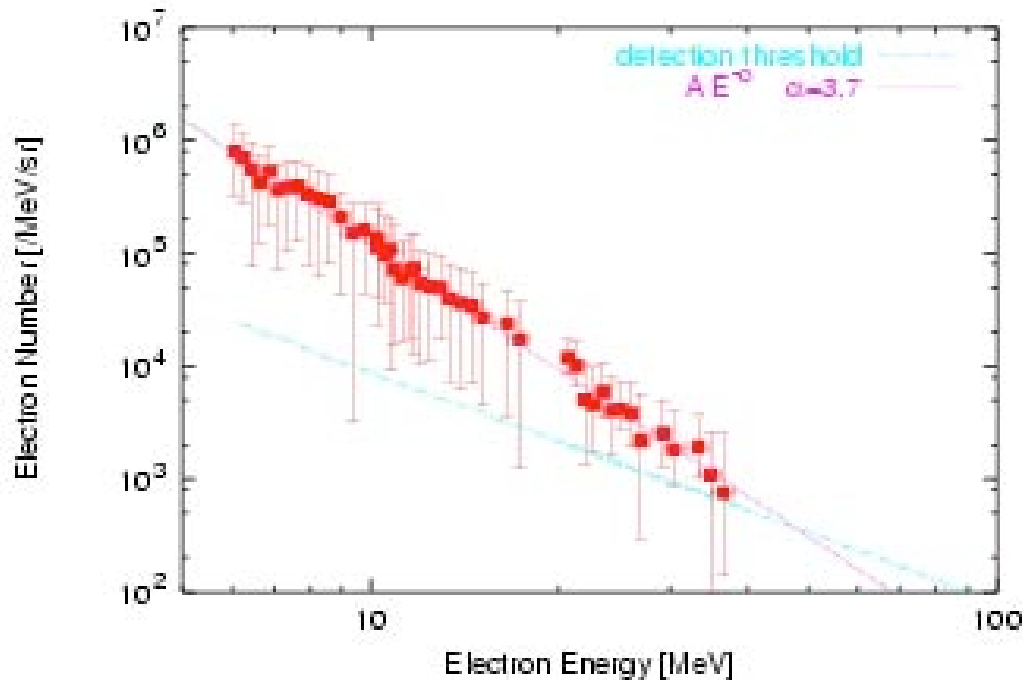

Laser

Pulse Energy: 420 mJ
 Pulse duration: 23 fs
 Contrast: $\sim 10^{-6}$

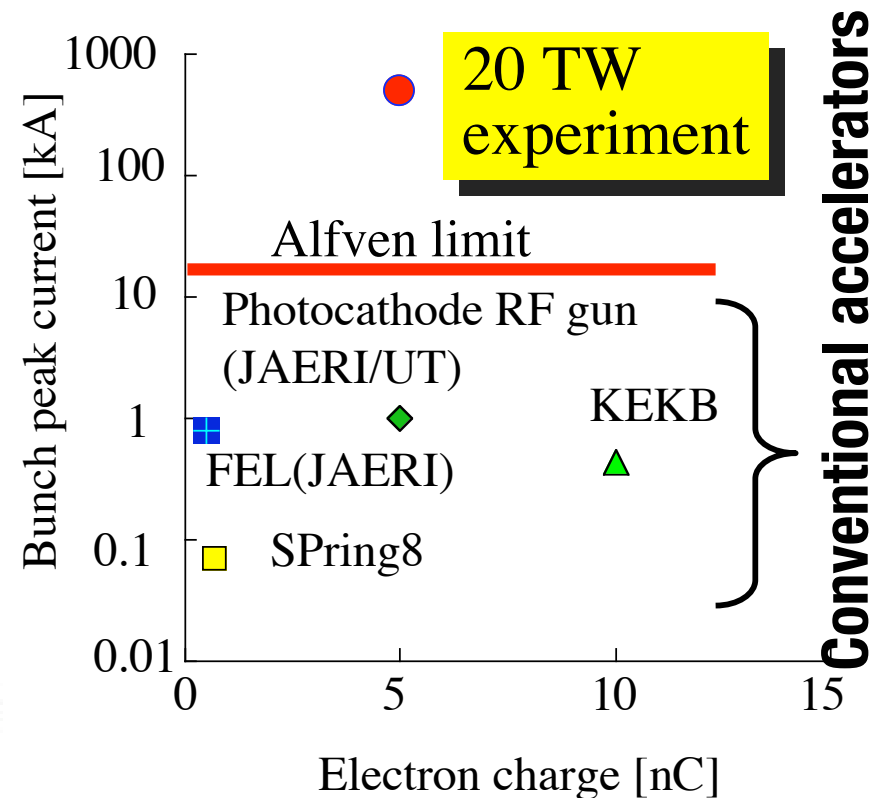

Ultrahigh current electron production experiments at JAERI-APRC, 2003

Energy spectra of laser-plasma electron acceleration at 2.3×10^{19} W/cm² ($a_0=3.3$), $n_e \sim 10^{20}$ cm⁻³.
Maximum Energy 40 MeV/mm

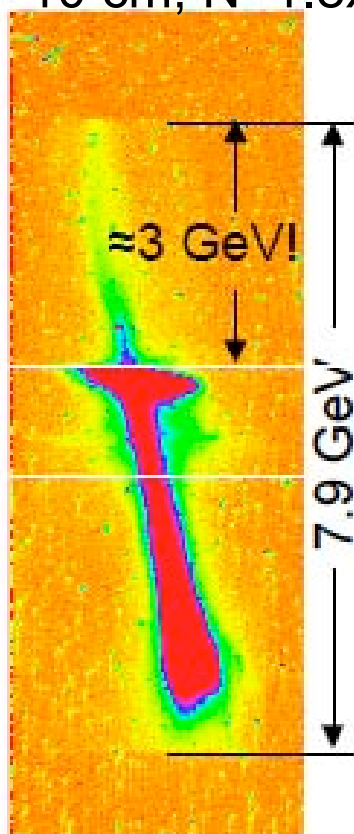

5nC/shot corresponding to Mega Ampere relativistic electron beams per shot

Plasma Wakefield Accelerators break through GeV Barrier in 10cm

PWFA experiments at SLAC FFTB, 2004

Energy gain reaches ~ 4 GeV
at $n_e \sim 2.55 \times 10^{17} \text{ cm}^{-3}$
for $L=10$ cm, $N=1.8 \times 10^{10}$

Proposed monoenergetic mechanism: Transverse Wave breaking

by S. Mangles, Imperial College London

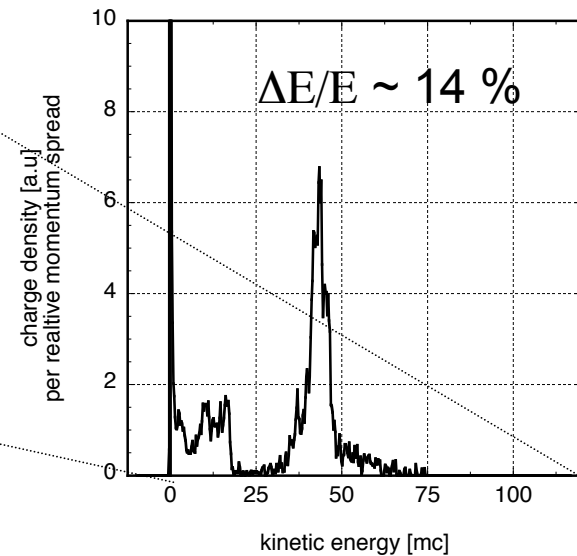

- Wave front is curved due to transverse profile of laser
- Injection happens from sides in these 2D3V simulations
- Very similar to “transverse wake wave breaking” described by Bulanov et al, PRL 78 4205 (1997)

How to make a monoenergetic spectrum

Interaction length < Dephasing length

Electron spectrum at 4.3 ps

- 1) Plasma wave becomes non-linear
- 2) Transverse wave breaking takes place - particles injected into wave
- 3) Further wave periods also break
- 4) Dephasing has occurred and energy spread is increased

Fine plasma density control is essential.

Simulations of electron acceleration for 200TW, 30fs, $n_p = 1.5 \times 10^{18} \text{cm}^{-3}$, $a_0 = 4$, $w_0 = 20 \mu\text{m}$

Distance = 0.98 Z_R

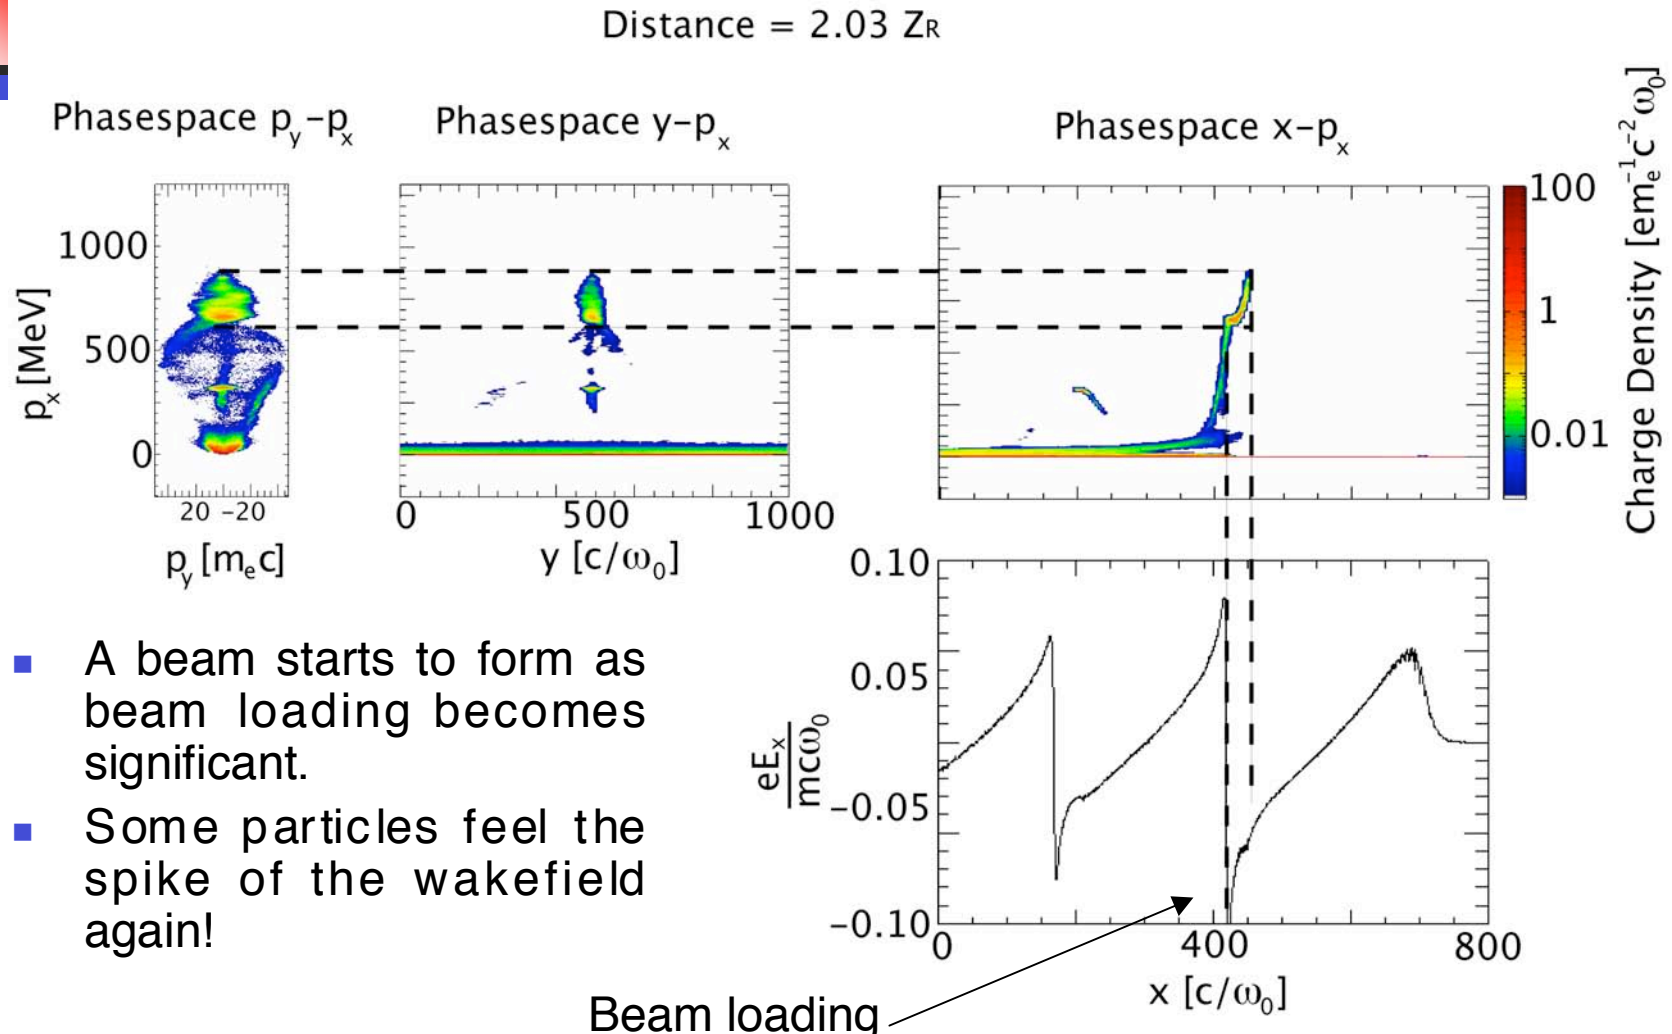

- At early times the accelerating fields are higher.
- A beam has not been formed yet.

Beam loading

by M. Tzoufras, UCLA, HEEAUP2005

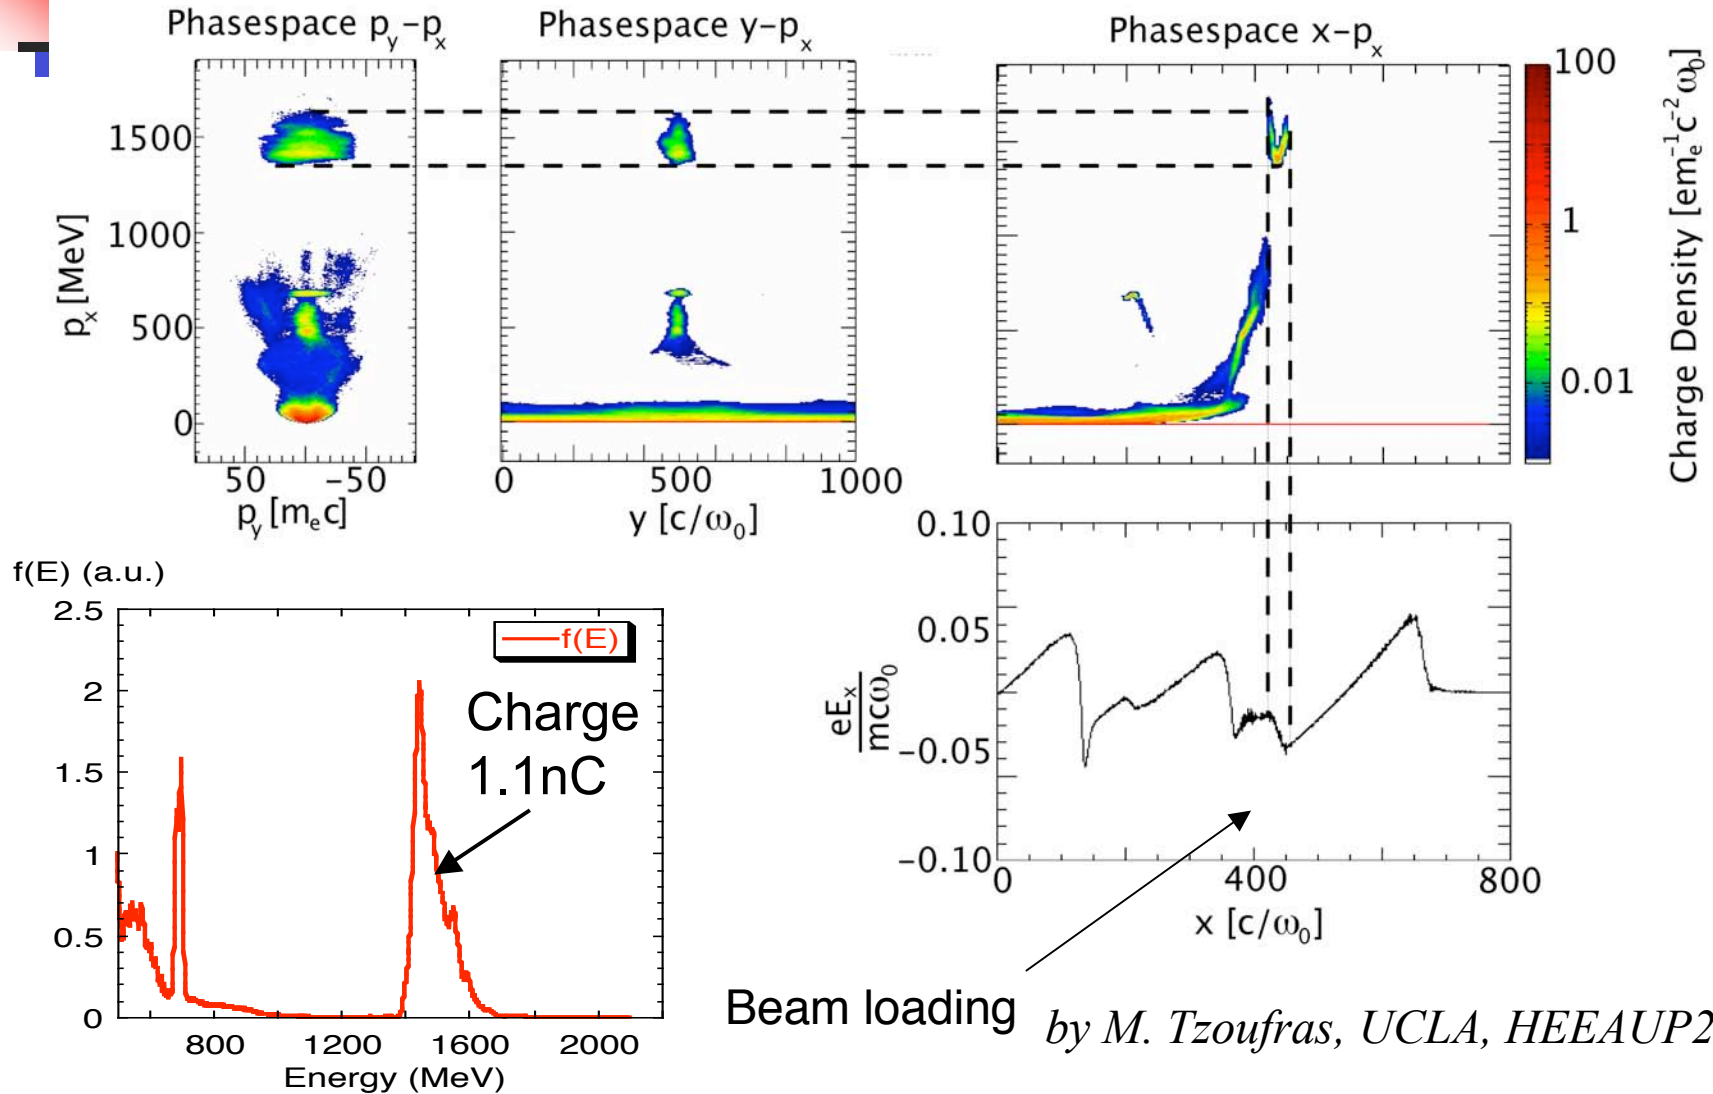

Simulations of electron acceleration for 200TW, 30fs, $n_p = 1.5 \times 10^{18} \text{cm}^{-3}$, $a_0 = 4$, $w_0 = 20 \mu\text{m}$

- A beam starts to form as beam loading becomes significant.
- Some particles feel the spike of the wakefield again!

Simulations of electron acceleration for 200TW, 30fs, $n_p = 1.5 \times 10^{18} \text{cm}^{-3}$, $a_0 = 4$, $w_0 = 20 \mu\text{m}$

Distance = $5.11 Z_R / 7.5 \text{mm}$

Beam loading by M. Tzoufras, UCLA, HEEAUP2005

Matched Blowout Acceleration

Wake amplitudes in the ultra-relativistic blowout regime ($k_p R_b \sim 4-5$).

$$\frac{eE_z}{mc\omega_p} \approx \frac{1}{2} \xi, \quad \frac{eE_M}{mc\omega_p} \approx \frac{1}{2} k_p R_b$$

Matched laser spot size is given by balance of ponderomotive and ion channel forces as approximately

$$k_p R_b \approx k_p W_0 \approx 2\sqrt{a_0}$$

For given laser power P and given plasma density n_p , this matching condition gives:

$$a_0 \approx 2 \left(\frac{P}{P_c} \right)^{1/3}$$

Deep spike

by W. Lu, UCLA, HEEAUP2005

Scaling formula for matched blowout acceleration

Self-injection condition: $a_0 \approx 4 \sim 5 \Rightarrow \begin{cases} \frac{P}{P_c} \approx 8 \sim 16 \gg 1 \\ k_p R_b \approx 4 \sim 5 \gg 1 \end{cases}$

For self-guiding: $a_0 > a_c \approx \left(\frac{n_c}{n_e} \right)^{1/5}$

Dephasing length: $L_{dp} \approx \frac{2}{3} \left(\frac{k_0}{k_p} \right)^2 R_b \approx \frac{4}{3} \left(\frac{k_0}{k_p} \right)^3 \sqrt{a_0} k_0^{-1}$

Pump depletion length: $L_{pd} \approx \left(\frac{k_0}{k_p} \right)^2 c\tau \approx 2 \left(\frac{c\tau}{R_b} \right) \left(\frac{k_0}{k_p} \right)^3 \sqrt{a_0} k_0^{-1}$

Energy gain: $\Delta E \approx \frac{2}{3} mc^2 \left(\frac{k_0}{k_p} \right)^2 a_0$ or $\Delta E \approx mc^2 \left(\frac{P}{P_r} \right)^{1/3} \left(\frac{n_c}{n_p} \right)^{2/3}$

Total charge: $N_b \approx \frac{3\lambda_0}{4\pi r_e} a_0^{3/2} \left(\frac{n_c}{n_e} \right)^{1/2} \approx 5.1 \frac{\lambda_0}{r_e} \sqrt{P}$

Scaling laws

by W. Lu, UCLA, HEEAUP2005

Verification of the scaling through simulations

As long as the laser can be guided (either by itself or using shallow plasma density channel), one can increase the laser power and decrease the plasma density to achieve a linear scaling on power.

$$\Delta E \propto P$$

Schemes for TeV energy frontier

Multi-staging scheme

- Successive acceleration of 10 GeV/cell energy gain over the length limited by dephasing or pump depletion.
- Matching between cell to cell → Spatial alignment
- Pumping power to each cell → Temporal synchronization

Single-staging scheme

- Single cell acceleration up to TeV energy
- Extremely high peak power pump laser

Both schemes need optical guiding through plasma channel

5 TeV e^+e^- LWFA Linear Collider consisting of staged plasma channels

Parameters of 5TeV e^+e^- Linear Collider based on LWFA

Collider parameters

CM Energy	E_{cm}	5 TeV
Luminosity	L_g	$10^{35} \text{ cm}^{-2}\text{s}^{-1}$
Emittance	E_y	2.2 nm
Beta at IP	β_y	22 μm
Beam size at IP	σ_y	0.1 nm
Bunch length	σ_z	0.32 μm
Number of particles	N	5×10^7/ bunch
Collision frequency	f_c	50 kHz
Average beam power	P_b	2 MW
Disruption parameter	D_y	0.93
Beamstrahlung parameter	Υ	3485

LWFA parameters

Plasma density	n_e	$3.5 \times 10^{17} \text{ cm}^{-3}$
Acceleration length	L_{ac}	20 cm
Accelerating gradient	E_z	55 GV/m
Energy gain/ stage	W	10 GeV
Laser power/ stage	P_{av}	100 kW
Laser pulse energy	E_L	2 J
Laser pulse duration	τ	100 fs
Laser peak power	P	20 TW
Number of stages		500
Total laser power		50 MW
Total length		$\sim 1 \text{ km}$

Single-stage TeV accelerator

by W. Lu, UCLA, HEEAUP2005

	Uniform plasma	20% deep plasma channel
Peak Power, P	1000 PW	120 PW
Pulse duration, τ	1 ps	1 ps
Plasma density, n_p	$6.5 \times 10^{15} \text{ cm}^{-3}$	$2 \times 10^{15} \text{ cm}^{-3}$
Spot radius, W_0	450 μm	470 μm
Acceleration length, L	80 m	280 m
a_0	12.1	4
Total charge, Q	120 nC	40 nC
Energy gain, ΔE	1012 GeV	1120 GeV

$$a_0 = 6.8 \sqrt{P [TW]} \frac{\lambda_0}{W_0} ; \text{ Normalized vector potential of laser field}$$

ICFA 38th Advanced Beam Dynamics and 9th Advanced & Novel Accelerators Joint Workshop on

Laser-Beam Interactions and Laser and Plasma Accelerators

4th LBI Workshop and 7th LPA Workshop jointly held in celebrating the United Nations International Year of Physics

FOCUS:

- Physics and applications of laser-beam and plasma interactions, including the generation of energetic particles, high-energy Gamma rays, short-pulse X-rays and Tera Herz radiations
- Laser and plasma particle acceleration concepts and experiments including computer modeling of experiments
- Mono energetic high quality particle beam generation in laser-plasma accelerators: mechanism, control and applications
- Over-GeV laser-plasma accelerator technology
- Extreme high-energy accelerator and collider concepts
- High energy density beam-plasma physics including laboratory astrophysics
- High energy density astrophysics including ultrahigh energy cosmic ray acceleration, Gamma ray burst and Cosmic jet
- Fundamental physics related to laser and particle beams
